# Australian energy storage power station grid connection price

## Overview

---

What will Project EnergyConnect do for South Australia?

When complete, Project EnergyConnect is expected to allow about 2.5 GW of new solar, wind and energy storage projects to connect into the grid. The interconnector will also reduce the risk of South Australia being “islanded” when its existing connection to the national grid, via Victoria, is lost.

What is Australia's current storage capacity?

The current climate Australia’s current storage capacity is 3GW, this is inclusive of batteries, VPPs and pumped hydro. Current forecasts by AEMO show Australia will need at least 22GW by 2030 – a more than 700 per cent increase in capacity in the next six years.

What will Australia's future electricity system look like?

The latest GenCost report recognises that Australia’s future electricity system needs a mix of technologies to remain reliable, secure and flexible – with cost being just one part of the equation. For the seventh year in a row, renewables remain the lowest-cost option for new low-emission electricity generation.

How much does Project EnergyConnect cost?

29 October 2025 The high-voltage grid transmission operator said the condensers will be deployed at five strategic sites across New South Wales. Transgrid has confirmed the cost of the New South Wales section of Project EnergyConnect has climbed to \$3.6 billion, well above the \$1.82 billion price tag that was originally approved.
