# Distributed hybrid energy storage system

## Overview

---

A distributed hybrid energy system comprises energy generation sources and energy storage devices co-located at a point of interconnection to support local loads.

A distributed hybrid energy system comprises energy generation sources and energy storage devices co-located at a point of interconnection to support local loads.

Distributed wind assets are often installed to offset retail power costs or secure long term power cost certainty, support grid operations and local loads, and electrify remote locations not connected to a centralized grid. However, there are technical barriers to fully realizing these benefits.

Hybrid energy storage systems (HESS), which combine multiple energy storage devices (ESDs), present a promising solution by leveraging the complementary strengths of each technology involved. This comprehensive review examines recent advancements in grid-connected HESS, focusing on their.
