Energy Communication Base Station Wind Power

Overview

A communication base station, wind-solar complementary technology, applied in the field of new energy communication, can solve the problems of inability to utilize wind energy to a greater extent, inconvenience, control of fan blades, etc., so as to improve the utilization rate of wind energy, reduce the probability of damage, and increase the contact area. Why are power systems and communication systems increasingly coupled?

Therefore, power systems and communication systems are increasingly coupled. A power system supplies energy, and a communication system meets the demand for information exchange. A BS is the main intermediary between a communication network and a power network.

What is the role of communication infrastructure in modern power systems?

This research underscores the crucial role of efficient communication infrastructure in modern power systems and presents a comprehensive approach that can be used to plan and operate both communication and power systems, ultimately leading to more resilient, efficient, and reliable networks.

What is a BS in energy management?

The MG is managed by an energy management controllers (EMCs) that coordinates the dispatch of energy in the MG by interacting with information from other EMCs. This information can be interacted with through a communication network. Therefore, BSs are the main intermediaries between communication and energy systems.

How does a base station work?

As shown in Figure S3 each user accesses a base station, and the BS then allocates a channel to each new user when there is remaining channel capacity. If all of the channel capacity of a BS is occupied, a user cannot access this BS and must instead access another BS that is farther away.
