# Flywheel energy storage at Tunisia power plant

## Overview

---

First-generation flywheel energy-storage systems use a large steel flywheel rotating on mechanical bearings. Newer systems use carbon-fiber composite rotors that have a higher tensile strength than steel and can store much more energy for the same mass. Overview Flywheel energy storage (FES) works by spinning a rotor ( ) and maintaining the energy in the system as . When energy is extracted from the system, the flywheel's rotational speed is reduced a .

A typical system consists of a flywheel supported by connected to a . The flywheel and sometimes motor-generator may be enclosed in a to reduce fricti.

Compared with other ways to store electricity, FES systems have long lifetimes (lasting decades with little or no maintenance; full-cycle lifetimes quoted for flywheels range from in excess of 10 , up to 10 , cycles.
