Guatemala Communications shuts down 5G base stations for power outages

Overview

When do cell phone masts go down?

Cell phone masts and associated equipment are switched off as soon as they lose their main power source. Therefore, although some users still see coverage or can even make calls in the first few minutes, the network gradually begins to go down.

Why should a telecom network be prepared for a power outage?

It is also possible to shut down certain equipment during times of lower site traffic to simply save on energy consumption. Preparing your network for power outages caused by weather and natural disasters with advanced technology will increase the resilience, reliability, and efficiency of your telecom sites.

Why do telecom sites fail?

In many parts of the world, telecom site equipment or resources like batteries or diesel fuel can lead to theft, which besides being a considerable expense in its own right, can also lead to sites failing when site damage due to theft is not detected.
