How is the energy storage system of China s communication base stations

Overview

Do communication base station operations increase electricity consumption in China?

Comparing data from 2021, 2025, and 2030, we found that the electricity consumption due to communication base station operations in China increased annually.

Can solar power improve China's base station infrastructure?

Traditionally powered by coal-dominated grid electricity, these stations contribute significantly to operational costs and air pollution. This study offers a comprehensive roadmap for low-carbon upgrades to China's base station infrastructure by integrating solar power, energy storage, and intelligent operation strategies.

How does a base station work?

In this scheme, the base station is powered by solar panels, the electrical grid, and energy storage units to ensure the stability of energy supply. When there is a surplus of energy supply, the excess electricity generated by the solar panels is stored in the energy storage units.

How much energy does a communication base station use a day?

A small-scale communication base station communication antenna with an average power of 2 kW can consume up to 48 kWh per day.^{4,5,6} Therefore, the low-carbon upgrade of communication base stations and systems is at the core of the telecommunications industry's energy use issues.

Why do Chinese communication companies rely on a power grid?

This is primarily due to the reliance of these base stations on the power grid, which derives over 70% of its energy from coal.^{19,20} Compounded by the Chinese government's stringent low-carbon policies, which mandate environmental responsibility across all industries,²¹ communication

companies face considerable policy pressure.

Why are China's leading communications companies incorporating energy storage batteries and photovoltaic power?

In addition, China's leading communications companies are progressively incorporating energy storage batteries and photovoltaic power generation to offset the mounting cost pressures stemming from the continued expansion of energy usage. The relative importance attached to this issue depends on the sense of urgency.
