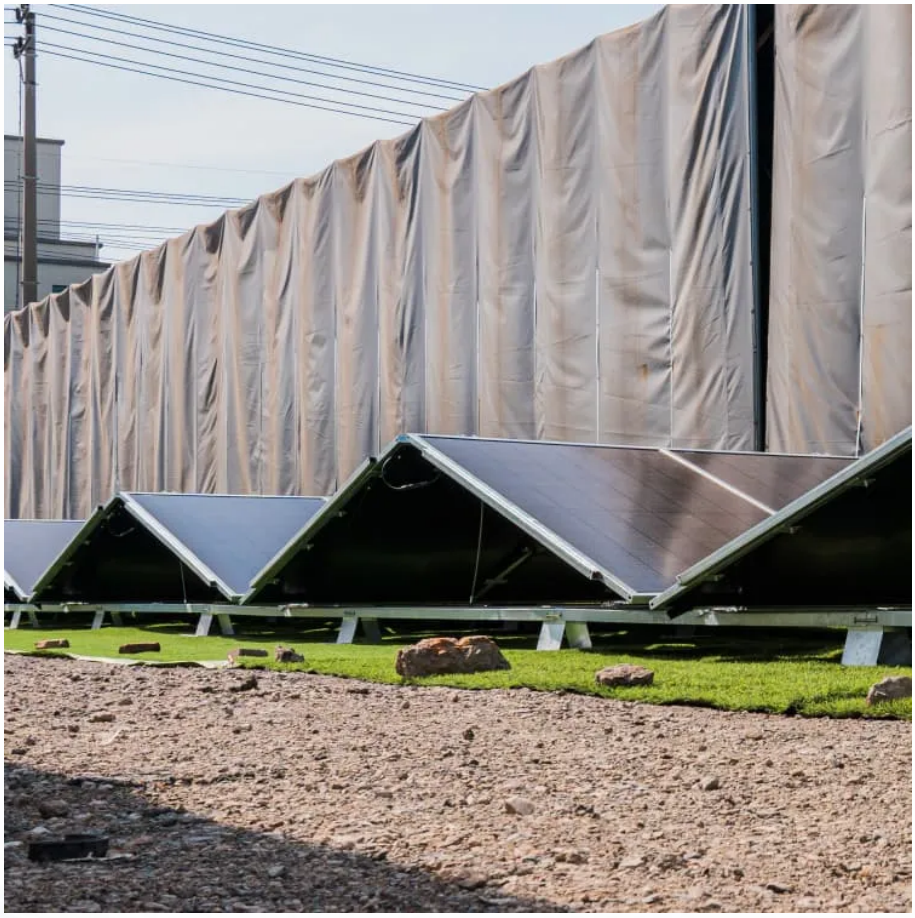
How many watts does a 5G base station generate



Overview

How much power does a 5G station use?

The power consumption of a single 5G station is 2.5 to 3.5 times higher than that of a single 4G station. The main factor behind this increase in 5G power consumption is the high power usage of the active antenna unit (AAU). Under a full workload, a single station uses nearly 3700W.

Why does 5G use more power than 4G?

The data here all comes from operators on the front lines, and we can draw the following valuable conclusions: The power consumption of a single 5G station is 2.5 to 3.5 times higher than that of a single 4G station. The main factor behind this increase in 5G power consumption is the high power usage of the active antenna unit (AAU).

What is a 5G base station?

A 5G base station is mainly composed of the baseband unit (BBU) and the AAU — in 4G terms, the AAU is the remote radio unit (RRU) plus antenna. The role of the BBU is to handle baseband digital signal processing, while the AAU converts the baseband digital signal into an analog signal, and then modulates it into a high-frequency radio signal.

How many HD movies can a 5G base station download?

Studies show that with 5G base stations, it is possible to download more than 5,000 HD movies using only 1 kWh, whereas with 4G, the same amount of power would allow for fewer than 200 movies to be downloaded.

Does 5G New Radio save energy?

Emerging use cases and devices demand higher capacity from today’s mobile networks, leading to increasingly dense network deployments. In this post, we explore the energy saving features of 5G New Radio and how this enables operators to build denser networks, meet performance demands and maintain

low 5G energy consumption.

How much power does a 4G tower need?

A typical 4G tower site would have 3 sectors, 2X2 MIMO (Multiple-Input Multiple-Output is a wireless technology that uses multiple transmitters and receivers to transfer more data at the same time) and 2 carriers. This takes the total transceivers to 3*2*2 = 12 TRXs. So, the total power demand at the site is 12 TRXs* (250W-500W) = 3kW to 6kW.
