Integrated energy storage power station

Overview

What are the components of an integrated energy station?

As shown in Fig. 1, an integrated energy station consists primarily of photovoltaic (PV), wind turbine (WT), gas boiler (GB), combined heat and power (CHP), absorption chiller (AC), electric chiller (EC), electric storage (ES).

What is integrated energy station?

Structure of the integrated energy station The integrated energy station is aiming to self-production and self-sales of renewable energy on the premise of meeting the local demand for electricity, heat and cooling through the full utilization of wind and solar output.

What are the planning results of Integrated Energy station?

The planning results of integrated energy station are evaluated based on system dynamics (SD), which has certain guidance for the actual project. Operation modes of combined heat and power (CHP) units are closely related to the economic benefits of energy application in integrated energy station.

How to optimize the configuration of Integrated Energy station?

Three operation modes of self-adaption, FEL and FTL are comprehensively considered to optimize the configuration of integrated energy station. On this basis, the sensitivity of heat-to-electric ratio (HPR) of CHP units and electric storage to the planning results are analyzed.

What is a generation-integrated energy storage system?

Generation-integrated energy storage (GIES) systems store energy before electricity is generated. Load-integrated energy storage (LIES) systems store energy (or some energy-based service) after electricity has been consumed (e.g., power-to-gas, with hydrogen stored prior to consumption for transport or another end-use).

Can integrated energy station provide energy to end-users?

Integrated energy station can supply energy to end-users cover, production, conversion and storage facilities. However, due to the uncertainties of renewable sources and terminals as well as resource endowments in different places, the construction of multi-energy system needs to be tailored to local conditions.
