

Kongres Container

Investing tens of millions in energy storage power stations

Overview

How big will a battery energy storage system be in 2024?

After record growth in 2024, U.S. battery energy storage systems (BESS) could grow from more than 26 gigawatts (GW) of capacity—enough to power 20 million homes—to anywhere from 120 GW to 150 GW by the end of 2030, depending on the range of projections.

Is battery energy storage a savior?

Today, technology advances and dramatic cost decreases combine to set up battery energy storage as the savior for both renewables and the overarching electric grid as power demand soars and Congress rapidly phases out tax credits for wind and solar energy.

How much will a data center cost in 2025?

A big part of that increase comes from the hyperscalers: Amazon, Google, and Microsoft are investing anywhere from \$75 billion to \$100 billion each into building data centers for 2025 alone. The combination of much more demand plus the loss of tax credits is expected to result in more spikes in commercial and residential electricity costs.

Which states are leading the way in Battery deployment?

California and Texas easily lead the way in battery deployment with massive grids and ample land, but the rest of the country is beginning to catch up.
