Large solar panels on-site energy

Overview

How can on-site solar PV & energy storage improve sustainability?

To achieve sustainability goals while meeting the increasing electricity demands of electrification, organizations are pairing on-site solar PV generation with on-site energy storage. These systems, which are considered as “behind-the-meter” (BTM) systems, allow facilities to maximize the benefits of on-site renewable generation.

Is on-site solar a good choice?

While not a de facto choice – especially for large hyperscale facilities – on-site solar is growing in popularity as companies look to boost their green credentials and save money against high energy costs. Operators large and small have deployed solar panels to the rooftops of their facilities.

Is rooftop solar a good option for a building?

Rooftop solar remains one of the most accessible and cost-effective ways to generate on-site power, particularly for facilities with high daytime energy usage. These systems can typically offset a large portion of energy consumption in a building and are relatively simple to install.

Can solar power power data centers & IT infrastructure?

Solar power has emerged as a game-changing solution for powering data centers and IT infrastructure. In recent years, the increasing concern for environmental sustainability and the rising energy demands of these facilities have propelled the adoption of solar power.

Do solar panels work everywhere?

Solar panels work everywhere in the United States, but some areas have more sunny, clear days than others, which means more energy production. Other factors to consider are the elevation of the land (the flatter, the better) and proximity to transmission lines and the point of electricity consumption (the

closer, the better).

How can a data center use solar energy?

Companies can install solar panels on rooftops, parking lots, or adjacent land to maximize solar energy generation. Power storage solutions, such as batteries, enable data centers to store excess energy for use during periods of low solar generation or high energy demand.
