# Miniaturization of zinc-bromine flow batteries

## Overview

---

In this review, the focus is on the scientific understanding of the fundamental electrochemistry and functional components of ZBFBs, with an emphasis on the technical challenges of reaction chemistry, development of functional materials, and their application in ZBFBs.

In this review, the focus is on the scientific understanding of the fundamental electrochemistry and functional components of ZBFBs, with an emphasis on the technical challenges of reaction chemistry, development of functional materials, and their application in ZBFBs.

In the early stage of zinc-bromine batteries, electrodes were immersed in a non-flowing solution of zinc-bromide that was developed as a flowing electrolyte over time. Both the zinc-bromine static (non-flow) system and the flow system share the same electrochemistry, albeit with different features.

The fundamental electrochemical aspects including the key challenges and promising solutions in both zinc and bromine half-cells are reviewed. The key performance metrics of ZBRBs and assessment methods using various ex situ and in situ/operando techniques are also discussed. Zinc-bromine.
