Romania s secondary solar power station power generation

Overview

Romania was a major player in the solar power industry, installing in the 1970s and 1980s around 800,000 m (8,600,000 sq ft) of low quality solar collectors that placed the country third worldwide in the total surface area of PV cells. One of the most important solar projects was the installation of a 30 kW solar panel on the roof of the that is capable of producing 60 MWh of electricity per year.

The new park features the newest photovoltaic technology and produces green energy through approximately 120,000 bifacial monocrystalline panels, model JA Solar 540 and 535 W, with a life span of 30 years, which is injected into the national electricity distribution grid with the help of 248 inverters.
