# Single-phase inverter connected to three-phase

## Overview

---

Are string inverters single phase or three phase?

Since most string inverters back then were single phase (sometimes referred to as split phase, meaning they had 2 hots, a neutral and ground), and most commercial buildings are three-phase (3 hots, a neutral and ground), people started asking questions. Oh, I should have started with a disclaimer, this post is going to get technical and very Codey.

Can a single phase inverter be installed on a 3 phase panel?

Yes, Virginia, you can install single phase inverters on a three phase panel as long as you do not cause any significant imbalance and keep it under 3%. Boring TL;DNR Answer This question has been coming up more frequently lately. I answered this many times at my previous company SMA America back in the early 2010s.

How does a 3 phase inverter work?

The inverter will synchronize with one of the phases in a three-phase grid, delivering power efficiently. This setup is usually sufficient for smaller residential systems and does not cause significant issues, ensuring you receive the same benefits as you would with a three-phase inverter.

Does a single-phase inverter send electricity to all three phases?

It is correct that a single-phase inverter will only send electricity to one of your home's three phases. But from your point of view, this doesn't matter. Because of net metering, you will still receive the full value of your solar generation across all three phases regardless of whether you have a single-phase inverter or a three-phase inverter.

How to connect a 3 phase inverter to a grid?

The AC output of the inverter should be connected to any phase. A three-phase meter should be installed before the grid to give export control to the

whole three-phase system. The connection of the three-phase meter is the same as in a normal three-phase system. Connect the signal cable to the “Meter/CT” port of the inverter.

How many single phase inverters should a commercial PV system have?

This is a valid question considering commercial PV designs had 10 to 20 single phase inverters speced in. The obvious and easiest solution would be to install PV inverters in sets of three so that all phases would be accounted for, meaning no phase on the three phase panel would not be connected to at least one PV inverter output on any leg.
