The difference between North Macedonia lithium battery packs

Overview

Learn the differences between battery cells, modules, and packs. See how each layer works, why BMS and thermal systems matter, and where these components fit in EVs and energy storage.

Learn the differences between battery cells, modules, and packs. See how each layer works, why BMS and thermal systems matter, and where these components fit in EVs and energy storage.

Batteries drive almost everything—from pocket-size gadgets to electric vehicles (EVs) and grid storage. Yet “battery” isn’t just one thing. It’s a layered system made of cells, grouped into modules, which are integrated into a complete pack. Understanding how these layers differ helps you choose.

Cylindrical battery cells were the first lithium-ion batteries to achieve mass production. They’re made by winding the cathode, anode, and separator in a specific order into a cylinder shape and then housing it in a metal casing. The most common sizes on the market today include 18650 (18mm).

The general structure of lithium batteries is a cell, battery module and battery pack. Battery cell technology is the cornerstone of battery systems. The process of assembling lithium battery cells into groups is called PACK, which can be a single battery or a battery module connected in series and.

Lithium-ion battery packs are essential power sources used in medical equipment, drones, robots, and countless other devices. These packs are made of multiple Li-ion cells (like 18650 or 21700) connected in series and/or parallel to provide specific voltages and capacities. Whether you need a 7.4V.

In fact, battery cell, battery module and battery pack are different stages of battery application. The structure of a lithium battery generally is battery cell -module- battery pack. The battery cell is the basic unit of the battery system. The process of assembling the battery cells into a group.

The primary distinction between a battery module and a battery pack lies in their scale and functionality. A battery module is a smaller unit that contains a

group of interconnected cells, often with its own BMS. It is a component within a larger battery pack, which consists of multiple modules.
