West African Telecommunication Base Station Wind Power Energy Plant

Overview

Should South Africa consider alternative energy options for the telecoms network?

International case studies indicated that South Africa is not unique in considering alternative energy options for the telecoms network when the national electricity grid is unreliable, with hybrid renewable systems potentially a more cost-effective and greener option.

Should telecommunications base stations be decarbonized?

In view of the increasing energy requirements of telecommunications base stations and the importance of decarbonizing the power supply to these assets, harnessing renewable sources of energy has become an option of increased interest to local and global network operators. 4.3 Diesel generator set.

How are telecommunication base stations energized?

Over the past twenty years, traditional power supply options such as the electrical grid, batteries, and diesel generators have been the primary sources of electricity for telecommunication base stations. Telecommunication base stations have also been energized by alternate electrical sources, including solar panels, wind turbines, and fuel cells.

How do network operators secure electricity supply in South Africa?

Due to the distributed nature of telecommunication network infrastructure, network operators will secure their electricity supply through agreements with various municipalities and, in some instances, directly with Eskom. Figure 4: Grid Supply in South Africa Source: CSIR Statistics of utility-scale power generation in South Africa in 2021.

Why is telecommunication infrastructure important in South Africa?

Unlike other developed countries where electricity is reliable, the design of

Telecommunication infrastructure in South Africa considers the scarcity of power or in certain instances, long interruption of electricity in the operation of Telecommunication infrastructure.

Where does South Africa's electricity come from?

South Africa's electricity generation comes from Eskom, Independent Power Producers (IPP), and regional imports. Currently, Eskom holds a monopoly in transmission and, to some extent, distribution, which is occasionally done by municipalities. Eskom manages the grid through load shedding, which is done manually through a planned schedule.
