# What is power generation in a power station

## Overview

---

In 2024, the electrical energy generation mix was 48.7% natural gas, 21.3% hydroelectric, 20.6% nuclear, 4.6% wind, 2.6% solar, 1.2% biomass, 0.3% petroleum, and 0.8% other. Small-scale solar including customer-owned photovoltaic panels delivered an additional net 4,526 GWh to New York's electricity grid in 2024.

In 2024, the electrical energy generation mix was 48.7% natural gas, 21.3% hydroelectric, 20.6% nuclear, 4.6% wind, 2.6% solar, 1.2% biomass, 0.3% petroleum, and 0.8% other. Small-scale solar including customer-owned photovoltaic panels delivered an additional net 4,526 GWh to New York's electricity grid in 2024.

Power generation is at the heart of NYPA's mission—and the core of our business. NYPA is the largest state public power utility in the country. Thanks largely to NYPA's three large-scale hydroelectric plants, New York State is able to produce a substantial portion of statewide power needs.

A power generating station (also called a power plant or power station) is an industrial facility that converts primary energy —such as chemical energy in fuels, nuclear energy, or kinetic/thermal energy from nature—into electrical energy.

So, how do power stations generate electricity?

By converting mechanical energy—whether from steam, water, wind, or sun—into electrical energy using turbines and generators.

A power plant's job is to release this chemical energy as heat, use the heat to drive a spinning machine called a turbine, and then use the turbine to power a generator (electricity making machine).What is a power generating station?

A power generating station (also called a power plant or power station) is an industrial facility that converts primary energy —such as chemical energy in fuels, nuclear energy, or kinetic/thermal energy from nature—into electrical energy. The output is synchronized with the grid, stepped up in voltage, and

transmitted to consumers.

What is a power station?

A power station, also called a power plant or generating station, is a large-scale industrial facility where electrical power is produced for distribution across an electrical grid. These stations utilize various energy sources—such as coal, natural gas, nuclear, hydroelectric, wind, and solar—to generate electricity.

What is power generation & how does it work?

What is power generation?

Electric power generation is the process of producing electricity from other forms of energy – be it the mechanical energy of a moving turbine, the heat from burning fuel, sunlight captured by a photovoltaic panel, or another source.

How do power stations generate electricity?

Understanding how power stations generate electricity requires examining different plant types: These plants burn coal, oil, or natural gas to heat water, creating steam that spins turbines. Despite environmental concerns, fossil fuel stations still supply a large portion of the world's electricity.

What is the difference between a power station and a generator?

The terms power station and generator are often used interchangeably, but they refer to distinct components within the electrical power supply system. Understanding the differences between a power station and a generator is crucial for industries, engineers, and consumers relying on consistent electricity.

How do power stations convert mechanical energy into electrical energy?

At the heart of every power station lies a fundamental principle of physics: the conversion of mechanical energy into electrical energy. This transformation typically happens through the use of a turbine-generator system.
