# Yemen Dazhou Communication Base Station Flow Battery

## Overview

---

How many batteries does a communication base station use?

Each communication base station uses a set of 200Ah·48V batteries. The initial capacity residual coefficient of the standby battery is 0.7, and the discharge depth is 0.3. When the mains power input is interrupted, the backup battery is used to ensure the uninterrupted operation of communication devices.

When does a base station need a backup battery?

When the power supply of the grid is good or the base station load is in a state of low energy consumption, the backup battery of the base station is usually idle. Reasonable evaluation of the reserve energy required by the base station is the premise of its response to the grid dispatching.

How does a base station reserve energy storage model work?

Compared with the situation without considering the communication traffic, the base station reserve energy storage model considering dynamic changes reduces the peak load of the region by 3.65 %, the difference between the peak and trough of the load curve by 10.59 %, and the sum of load changes at adjacent moments by 17.50 %.
